

We all know dye lots can vary from fabric to fabric (just like your favorite pair of jeans). So, at Georgia Expo, we've invested in the latest technology to make sure that you get the closest color shade match from order to order, whether you're reordering next week or 10 years from now.

## OUR PROCESS

First, each new fabric roll is scanned (3 times to get an average for the roll) and sorted according to a shade color indicator.

Then, all rolls are analyzed with a computer program to determine which Georgia Expo shade they fall into.

Tolerance Values

LC Ratio		P/F DEcmc		
DEcmc	DE2000/94/99	Number Visual Steps (Block Range)		
2.00	1	From System		
Tolerances				
From System	DL*	DU*	DC*	DH*
P/F Tolerance	1.00			
Upper	-1.500	-1.540	-1.640	-1.930
Lower	-1.500	-1.540	-1.640	-1.930
Margin	0.10			
From System				

Finally, when new shades are made, they are assigned tolerances to ensure that the fabric is a close match to everything within that shade.

## FOR YOU TO KNOW:

- Invoices will have the shade number listed so that when you order in the future we can match your shade.
- You can send us an example of existing inventory to be scanned. We can then send you examples of the closest available shade for approval.
- All shades are stored and documented so that we can match.

If you are dye lot sensitive, be sure to keep your shade on record to let us know and we can give you the closest possible match. Remember as well, you can always ask for shade samples!

Note for graphics: Taking the human eye out of the equation and leaving it to the certainty of an algorithm ensures the closest possible shade matches.
